1. Preliminary Instructions

This manual is designed to provide a general guide to skilled and qualified personnel, who are aware of the dangers that may arise when handling electric and electronic circuits.

It does not aim to provide a complete description of all the safety precautions that must be observed by people who use this or similar equipment.

The installation, operation, maintenance and use of this equipment involve risks both for people and the equipment itself, which must be handled only by experienced technicians.

R.V.R. Elettronica SpA does not assume responsibility for injuries to persons or damage to items caused by improper use or incorrect usage procedures, whether the users are experienced or not.

Users should observe local regulations and fire-prevention rules while installing and using this equipment.

WARNING: always disconnect the power before opening covers or removing any part of the equipment.
Take appropriate earthing measures to discharge the condensers and high voltage points before doing any maintenance work.

WARNING: this equipment may radiate radio-frequency energy, and if it is not installed according to the instructions, may cause troublesome interference to radio communications.
Operating this equipment in a residential environment may give rise to radio disturbance; if so, the user may be asked to take appropriate counter measures.

R.V.R. Elettronica SpA reserves the right to make modifications to the design and technical specifications of the equipment, and to update this manual without notice.

This page was intentionally left blank

2. Warranty

The guarantee, which is for 12 (twelve) months, is valid for any R.V.R. Elettronica product.

On components such as valves for finals, the manufacturer's guarantee applies.

R.V.R. Elettronica extends all transferable original guarantees to its own products. To ensure that servicing is carried out properly and as fast as possible, the work shall be handled by R.V.R. Elettronica; any claims should be sent directly to R.V.R. Elettronica, in accordance with the defined procedures.

The warranty does not include:

1 damage while the equipment is being shipped to R.V.R. for repairs;

2 any unauthorized modification or repair;

3 accidental damage, or damage not due to defects in the equipment;

4 nominal damage not accidental;

5 shipping the equipment and insuring it, and replacement of parts or units.

Any damage to the equipment caused during shipment must be reported to the transporters and notified in writing on the forwarding receipt.

Any difference or damage discovered after delivery must be reported to R.V.R. Elettronica within 5 (five) days from the delivery date.

To take advantage of the guarantee, adopt the following procedure:

1 Contact the retailer or dealer where you bought the equipment; describe the problem or fault to check if there is a simple solution.

Retailers and Distributors can provide full information on the problems that occur most frequently; they can normally repair the equipment much faster than the manufacturer

2 If your dealer cannot help you, contact R.V.R. Elettronica and describe the problem to them; if necessary, you will be sent authorization with the necessary instructions;

3 When you have received authorisation, return the equipment carriage paid to the address specified.

Pack it carefully, if possible in the original packing, and seal the package.

Do not return the machine without prior authorization, otherwise it may be returned to you

4 Quote the machine's type, model and serial number; attach a written technical diagnosis listing all the problems and faults encountered, and enclose a copy of the invoice.

Replacement of parts under guarantee or spare parts can be ordered from the following address:

R.V.R. Elettronica SpA
Via del Fonditore, 2/2c
40138 BOLOGNA
ITALY
Tel. +39 051 6010506

quoting type, model and serial number of the device.

3. First Aid

Personnel involved in the installation, use, and maintenance of the equipment must be familiar with the theory and practice of first aid.

3.1 Treating electric shocks

3.1.1 If the victim is inconscious

Follow the first aid principles described below.

- Lay the victim down on his back on a rigid surface
- Free the respiratory tracts by raising the neck and pushing the forehead back (Figure 1).
- If necessary, check the breathing of the victim opening his mouth.
- If the victim is not breathing, start artificial respiration immediately (Figure 2): incline the head, close the nostrils, apply your mouth to the victim's and make four fast respirations.

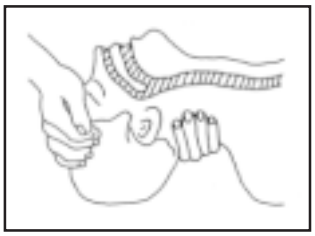

Figure 1

Figure 2

- Check the heart beat (Figure 3); if there is none, start a cardiac massage immediately (Figure 4) pressing the sternum approximately at the centre of the chest (Figure 5).

Figure 3

Figure 4

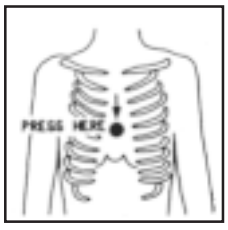

Figure 5

- If there is just one person providing first aid, he must adopt a rhythm of 15 compressions and 2 fast respirations alternately.
- If there are two persons, the rhythm must be 1 respiration and 5 compressions alternately

- Do not interrupt the cardiac massage during the artificial respiration.
- Call a doctor as soon as possible

3.1.2 If the victim is conscious

- Cover the victim with a blanket
- Keep him calm.
- Loosen the victim's clothes and keep him lying down
- Call a doctor as soon as possible

3.2 Treating electric burns

3.2.1 Large-scale burns and serious cuts

- Cover the area concerned with a sheet or a clean cloth.
- Do not break the blisters; remove any fabric and parts of clothing that may be attached to the skin; apply a suitable ointment.
- Treat the victim depending on the type of accident.
- Take the victim to hospital as soon as possible.
- If the arms and legs are injured, keep them raised.

If no medical help is available within an hour and the victim is conscious and has not retched, administer a liquid solution of salt and bicarbonate of soda: 1 teaspoonful of salt to every 250ml of water.
Get the victim to slowly drink half a glass of the solution, four times, over a period of 15 minutes.
Stop the treatment if the victim starts to retch.

Do not administer alcoholics!

3.2.2 Less serious burns

- Apply cold gauze compresses (not iced) using a clean cloth (i.e. as clean as possible).
- Do not break any blisters; remove any fabric and parts of clothing that may be attached to the skin; apply a suitable ointment.
- If necessary, dress the victim in clean dry clothes.
- Treat the victim depending on the type of accident.
- Take the victim to hospital as soon as possible.
- If the arms and legs are injured, keep them raised.

4. General Description

RVR Elettronica's RX1-NV is a professiona FM receiver with harmonic distortion lower than 0.1%. Its audio characteristics make it suitable for broadcasting applications, where high fidelity performances are needed.

Its external box is 2HE high and mountable on standard 19" racks.

The user interface comprises a graphic LCD display and a knob (encoder). Using this elements, it is possible to read all the working parameters of the device and to modify the changeable parameters, for example the working frequency or the audio output configuration.

In the standard version of the receiver, the demodulated signal is provided to the user in the form of MPX (that is, the composite baseband signal) as well as in the form of mono. There are also two connectors for the output of RDS or SCA subcarriers.
As an option, the RX1-NV can be equipped with a stereo decoder section. In this version, the output of the device comprises the left and right channels, the MPX signal and the possible subcarriers.

Two types of RF front-end sections are available.
The standard version employes a RF filter that is tuned on the working frequency; this kind of front-end is particularily suitable when the receiver is part of a retransmitting system, since it gives the best quality in the received signal.
Optionally, the RX1-NV can be equipped with an input section featuring a RF filter that is automatically tuned by the control software when a certain working frequency is selected. This kind of front-end also includes a double antenna input; the used antenna input is selectable via software.

The RX1-NV is designed in a modular way: the different functionalities are performed by modules that are directly connected with male and female connectors or using connector-terminated flat cables. This kind of design facilitates the maintenance or the possible substitution of the modules.

The receiver's control software implements an alarms system that is completely user-configurable. Among the possibilities, an important one is the capability of changing the working frequency if an alarm is raised.

The RX1-NV can also be fitted with a RDS board, than enables the user to controlthe different RDS parameters and to manage alarms as a function them.

The RX1-NV offers an auxiliary audio input, that is particularily useful when one doesn't want to let silence intervals to go on air: if an audio signal is connected to this input, it will be routed to the audio output of the receiver as soon as the muting function is triggered.

5. Quick Start

This chapter gives a concise view of the points that are necessary for the installation of the device. If any item is not completely clear, for example when you use the receiver for the first time, we strongly suggest to read throughly the manual and the description of the operating system.

5.1 Using the encoder

The interaction between the user and the receiver's control software is performed using the encoder (fig. 5.1).

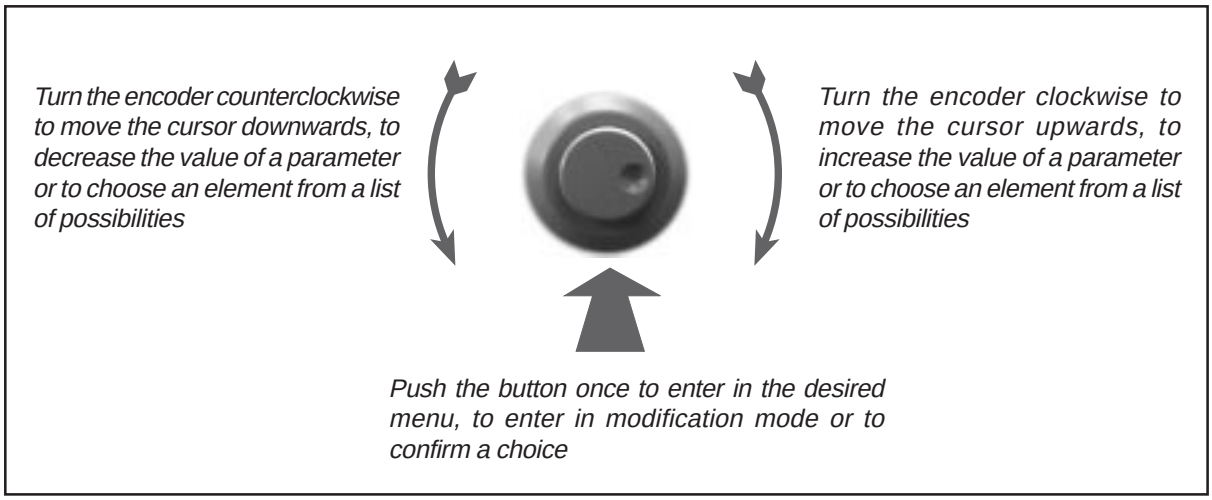

Figure 5-1

The operations supported by the encoder are:

- **rotation**: moves the cursor shown on the display; if you turn the encoder to the left (counterclockwise), the cursor moves downwards, if you turn it right the cursor moves upwards; it also permits to increase or diminish the parameters (turning the encoder left diminishes the parameter, turning it right increases it) or to select an item form a list of options
- **pushing**: push the button once when the cursor is on the name of a menu to enter in that menu, push it when the corsor is on the name of a parameter to enter in modification mod (the cursor starts blinking); after the modification of a parameter, push the button to save the new value.

  After having modified the value of a parameter, the cursor goes on blinking for approximately 30 seconds, waiting for confirmation from the user. If the user doesn't confirm the new value (i.e., the button is not pressed), the device emits a sound to indicate that no modification has been saved; the cursor stops blinking and remains on the selected parameter.

5.2 Preparation

Unpack the receiver and before any other operation make shure that no damage due to the transport is present. In particular, inspect the conditions of all the connectors.

Check if the mains voltage is correct for your site. The selector is on the rear panel and the selected value is indicated by an arrow. If required, extract the fuse/selector block levering with a little screwdriver. Rotate the block until the correct printed value corresponds with the arrow, then reinsert it.

The correct value for the mains fuse is 2 A.

Verify that the mains switch of the unit is on the OFF position.

Connect to the RF input of the receiver the antenna cable. If your receiver includes the double RF input option and you use only one antenna, we suggest to use the input called A1.

Connect the mains power supply cable to the relative socket.

NOTE: this piece of equipment shall be correctly connected to earth. This is necessary both for safety reasons and to obtain the receiver's correct performances.

Finally, connect the audio output of the receiver to the devices that will use it, depending on the configuration of your installation.

5.3 Operation

Warning: Before using the receiver for the first time, we suggest to get familiar with the machine's control system reading this manual in full, and specifically chapter 7 (operating system).

Switch the receiver on using the switch on the front panel.

At start up, all the LEDs on the front panel are briefly switched on to permit the verification of their functionality. The display then shows some information regarding the model of the device (fig. 5.2).

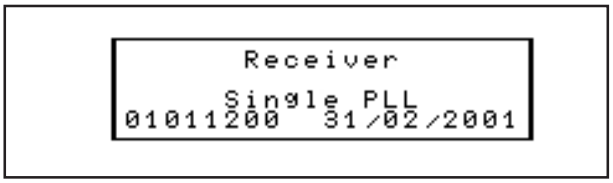

Figure 5-2

If the receiver is working correctly, the LEDs “alarm” and “waiting” will be off. The respective meanings are that the power supply is correct, and that the PLL is locked on the working frequency.

At this point, the software enters the main cycle, displaying the default screen.

Figure 5-3

The default screen can be divided in the following part:

- Left column: status icons. The icons that can be shown are the following:
  - The PLL is locked
  - This icon is present if the receiver is working on the backup setup (frequency and antenna)
  - Indicates that the working frequency is centered with respect to the received carrier
  - This icon means that the auxiliary input is routed to the audio output. This situation is bound to the intervention of the muting functionality.
  - This icon is present if the received program is stereo (only with Stereo decoder or/and RDS decoder options)
  - Indicates that the RDS signal is correctly received (only with RDS decoder option)
- On the right of the icons, there is a double VU-meter column that indicates the instantaneous modulation level. 100% in this scale corresponds to a standard 75 kHz modulation
- The upper part of the screen contains the following indications:
  - Working frequency (modifiable)
  - Antenna used (A1 or A2, modifiable only when the tuneable RF front-end is present)
  - Offset between set and received frequencies
  - Analog representation of the received signal level
  - Muting level setting
- In the lower part of the screen, there is a bar (inverted visualization) indicating the status of the automatic managment system of the machine

  `Mut` This is the “muting” status. `Off` indicates that the muting function is idle, so that at the receiver’s output there is the received signal; `On` indicates that the muting is activated, so that the receiver’s output is silenced, or replicates the Aux In, if such input is used.

Note: the visualization of the following states is enabled only if the receiver is configured for automatic alarms management

- `Ant` "Antenna": `Off` indicates that automatic commutation on the backup setup (frequency and antenna) is disabled. It corresponds to the menu item `Admin –> Auto –> Auto Off`
- `Sig` "Signal", indicates the activation (`On`) of the automatic system depending on the receiver signal level. It corresponds to the menu item
  `Admin –> Alarm –> Signal Alm –> Rescue`
- `Aud` "Audio", indicates the activation (`On`) of the automatic system depending on the demodulated audio level in the received signal. It corresponds to the menu item
  `Admin –> Alarm –> Audio Alm –> Rescue`
- `Ste` "Stereo", indicates the activation (`On`) of the automatic system depending on the pilot tone level in the received signal. It corresponds to the menu item
  `Admin –> Alarm –> Stereo Alm –> Rescue`
- `RDS` "RDS", indicates the activation (`On`) of the automatic system depending on the correctness of the received RDS frames. It corresponds to the menu item
  `Admin –> Alarm –> RDS Alm –> Rescue`

- In the right part of the default screen there is the menu item (`[Admin]`) that permits to go on to the administration menus. This element is visible only when one is in "input mode", that is when the encoder is moved.

Tipically, the operations that are necessary to perform at the first start-up of the receiver are the following:

- (Only if automatic alarms management is enabled) - Verify in the status bar of the default menu that the audio output "`AFO`" is set on "`Rec`" and that the various automatic settings are all disabled (`Off`)
- (Only if the tunable front-end is present) - With the encoder, select the antenna input to be used. Each time you push the encoder the antenna input is switched
- Set the working frequency:
  - with the encoder select in the default menu the item "frequency"
  - push the encoder to enter in the frequency modification menu
  - push the encoder on the frequency value to enter in modification mode
  - turn the encoder until the desired frequency is reached; when the set frequency is at the center of a received radio station, the icon ▸◂ is shown.
  - push the encoder to store the new frequency
  - confirm your choice pushing the encoder on "`Yes`"
  - push the encoder on "`Exit`" to go back to the default screen

- Set the desired muting level as described hereafter:
  - with the encoder, select in the deafult screen the line related to the muting level
  - push the encoder to enter in edit mode
  - rotate the encoder to select the desired muting level
  - push the encoder to store your selection

  Plese remember that if you feed the receiver with an audio signal using the Aux In input, when the muting function is activated the supplied audio signal is routed to the receiver's output. If no auxiliary audio is used, the muting intervention will just produce silence at the output.
- If it is necessary, check the settings of the audio section (`ADMIN` –> `BdSet`) and of the stereo board if it's present (`ADMIN` –> `StSet`). To know more about these menus, please check chapter 7.
- If the device is configured for automatic alarms management, set the related parameters. For details, see chapter 7.

5.3 Adjusting

The only adjustments that have to be manually done on the RX1-NV are those related to the output levels.

On the rear panel, you will find a trimmer for each of the independent output. When you insert the receiver in a system, you will have to adjust the level depending on your system configuration.

On the front panel there is a mono jack plug for phone output. Above the plug, a trimmer permits to adjust the level.

Using the software, it's possible to adjust all the parameters of the alarm system. The different parameters and the working principles of the alarm system are described in chapter 7.

For receivers fitted with tuned RF front-end, changing the working frequency requires the intervention of technically skilled personnel and the use of suitable instruments. The procedure to be used is described in chapter 9.

This page was intentionally left blank

6 External Description

This chapter describes the different elements that can be seen on the front and rear panels of RX1-NV.

6.1 Front panel

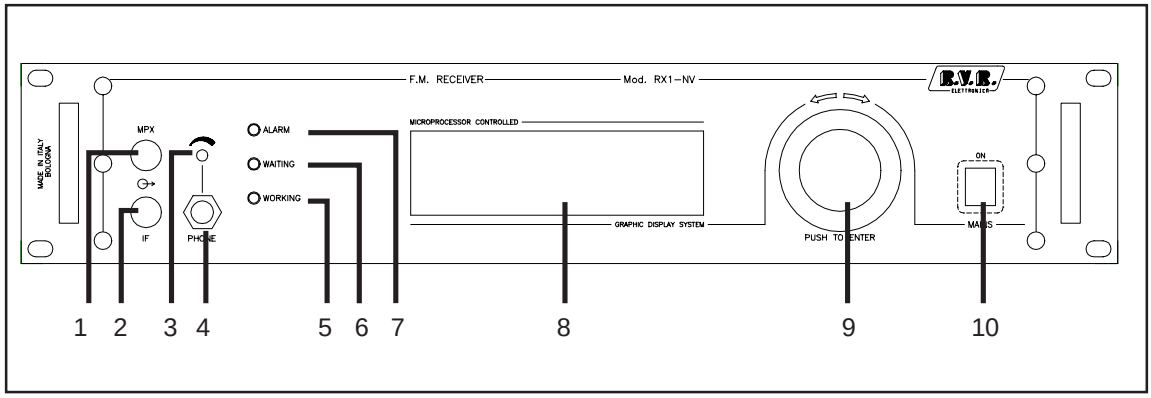

Figure 6-1

[1]	MPX	MPX Output Monitor BNC connector
[2]	IF	IF monitor BNC connector
[3]	VOL	Regulation trimmer for the phone plug
[4]	PHONE	Jack plug for phone output
[5]	WORKING	Green LED, lit when the device is working
[6]	WAITING	Yellow LED, lit when the receiver is waiting for the PLL to lock
[7]	ALARM	Red LED, lit if the receiver is out of order
[8]	DISPLAY	LCD graphic display
[9]	ENCODER	Knob/button to control the machine
[10]	MAINS	Mains supply switch

6.2 Rear panel

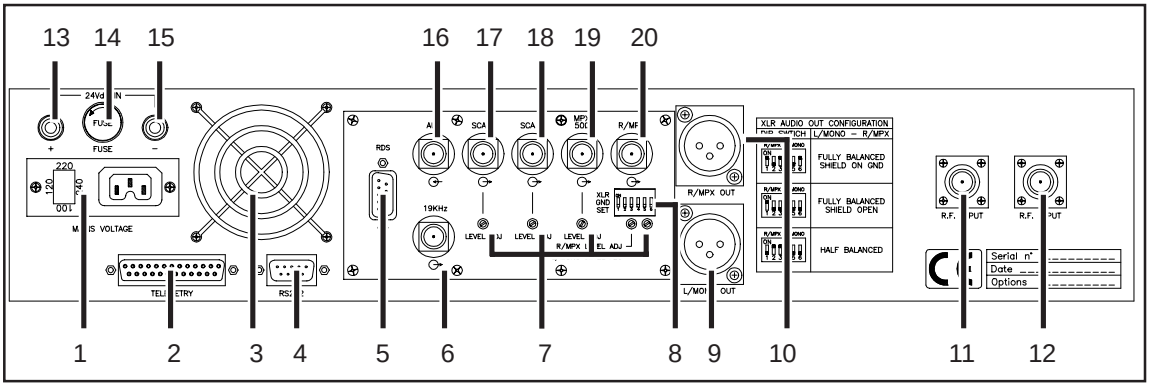

Figure 6-2

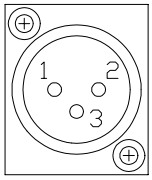
[1]	PLUG	mains plug with fuse and voltage changer
[2]	TELEMETRY	DB25 female connector for telemetry signals
[3]	FAN	fan for forced ventilation
[4]	RS232	DB9 female connector for direct or modem serial communication
[5]	RDS	DB9 female connector for RDS output (if installed)
[6]	19KHz	BNC for regenerated 19 kHz subcarrier
[7]	Trimmers	Output level adjusting trimmers
[8]	Dip Switch	miniswitch for XLR connectors grounding configuration
[9]	L/Mono	XLR connector for Left/Mono output
[10]	R/MPX	XLR connector for Right/MPX output
[11]	ANTENNA	N-type connector for antenna input (A1)
[12]	ANTENNA	N-type connector for antenna input (optional, A2)
[13]	24V +	24Vcc positive input connector (red)
[14]	FUSE	Vcc supply fuse
[15]	24V -	24Vcc negative input connector (black)
[16]	AUX IN	Auxiliary audio input
[17]	SCA 1	BNC connector for SCA/RDS output
[18]	SCA 2	BNC connector for SCA/RDS output
[19]	MPX 50 Ω	demodulated MPX signal output, buffered to drive a 50 Ω load with up to 250 mt RG58 cable
[20]	R/MPX	BNC connector for Right/MPX output (in parallel with [10])

6.3 Connectors description

6.3.1 Audio output

Type: XLR female



1 Ground
2 Signal (+)
3 Signal (-)

This description is valid for balanced configuration.
In unbalanced configuration, pin 3 is at ground.
The possible configurations of XLR connectors are described on the rear panel.

6.3.2 Telemetry

Type: DB25 female

	Standard version	With alarms card options
1	GND	GND
2	N.A.	Signal level alarm
3	N.A.	Signal level alarm
4	V Field (Analog O)	V Field (Analog O)
5	Reset CPU if grounded	Reset CPU if grounded
6	I2C SDA	I2C SDA
7	I2C SCL	I2C SCL
8	Mutes the output if grounded	Mutes the output if grounded
9	GND	Mute alarm
10	Mute demodulatore (TTL O)	Mute alarm
11	N.A.	Pilot level alarm
12	GND	Pilot level alarm
13	GND	RDS level alarm
14	N.A.	RDS level alarm
15	N.A.	RDS PI alarm
16	N.A.	RDS PI alarm
17	GND	Receiving on antenna 2 alarm
18	GND	Receiving on antenna 2 alarm
19	I2C GND	I2C GND
20	GND	GND
21	Mutes the demodulator if grounde	Mutes the demodulator if grounded
22	Frequency unlocked (TTL O)	Receiver fault alarm
23	GND	Receiver fault alarm
24	N.A.	Audio level alarm
25	GND	Audio level alarm

The alarm pins on the optional board are of the type “dry contact”.

This page was intentionally left blank

7. Operating System

The receiver's control software structure is divided into a default menu and a series of administration menu (figure 7.1). One of the default menu items ([ADMIN]) permits to pass to the administration menus.

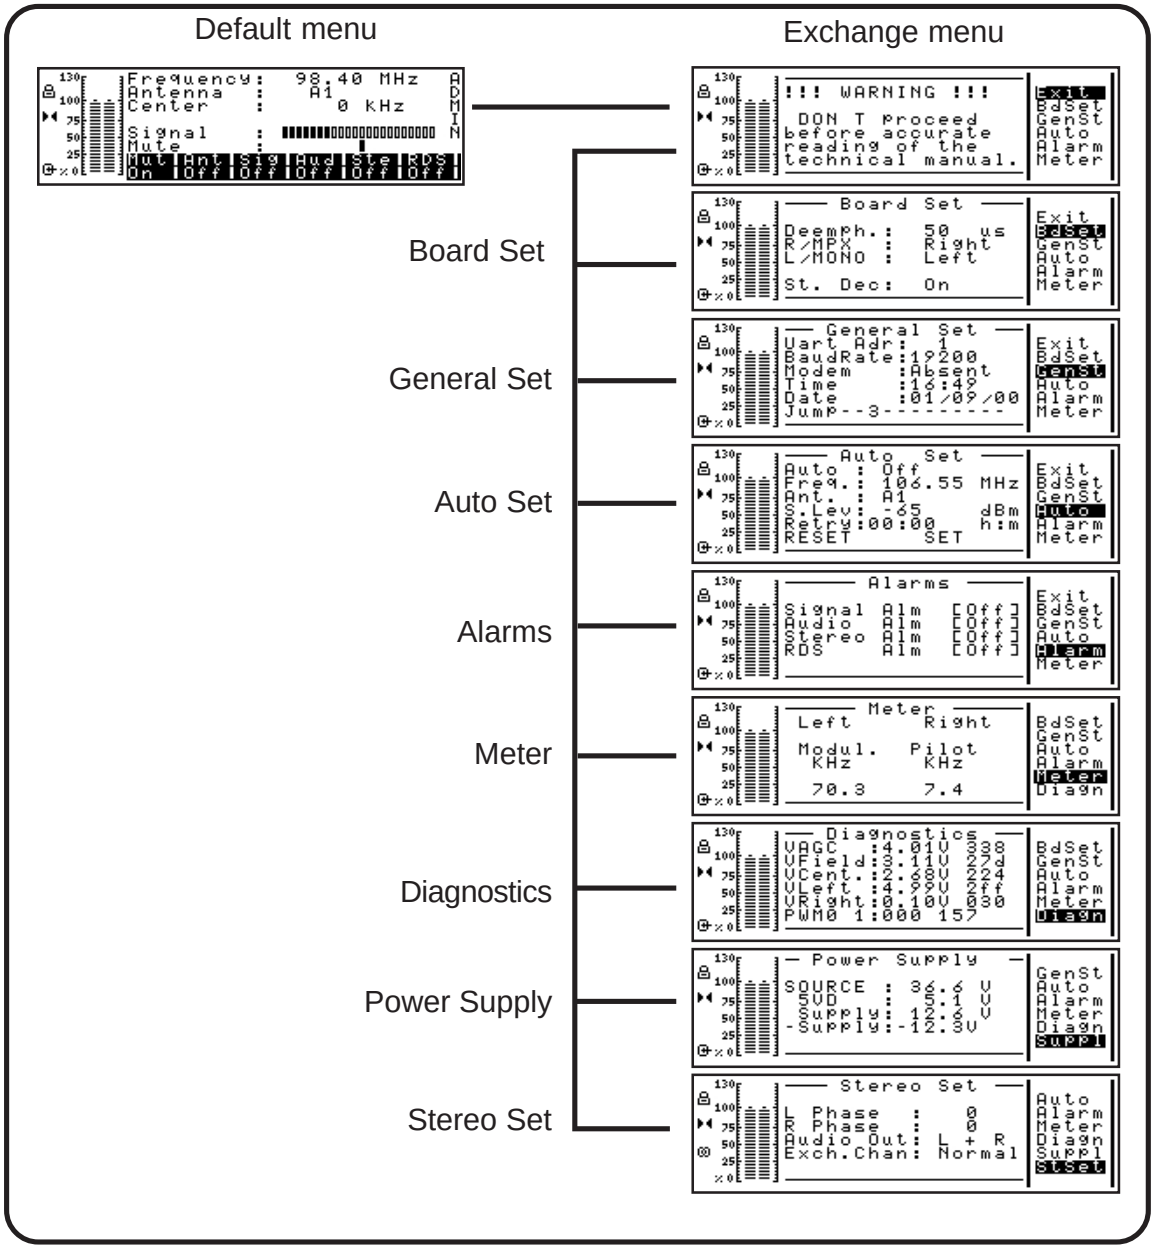


Figure 7-1

For the description of the default menu, please refer to chapter 5.3

7.1 Exchange menu (“Exit”)

This menu is the exchange point between the default menu and the administration menus set. When the user reaches this screen from the default menu using the [ADMIN] item, he will be warned to proceed only after reading the manual of the receiver:

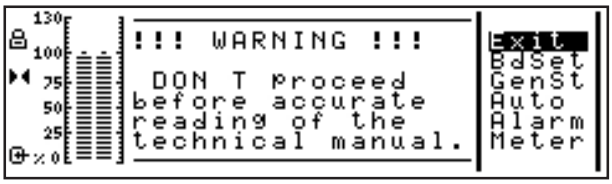

Figure 7-2

When one reaches this screen coming from an administration menu, there will be only the indication to push the button to go back to the default menu.

7.2 Board Set

This menu is related to the audio section settings of the receiver.

Figure 7-3

`Deemph` decides the kind of deemphasys to be applied to the audio signal (mono or left and right). The possible choices are 0, 25, 50 or 75 us.

`R/MPX` describes the R/MPX output

`L/Mono` describes the L/Mono output.

`St.Dec` this menu item, that is shown only if the stereo decoder is installed, allows to activate or deactivate it. When the stereo decoder is deactivated, the receiver behaves the same as if it was not fitted with the board.

7.3 General Setting

General setting menu.

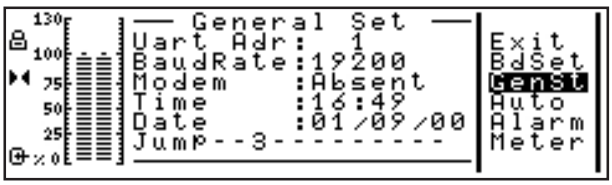

Figure 7-4

UART ADR
: address of the RX1-NV (serial port and IIC protocol), selectable between 1 and 200. If the receiver is in a stand-alone configuration, the address has to be set to 1

BAUD RATE
: tranfert rate of the RX1-LCD serial port

MODEM : configures the device to use a modem (Present) or the direct cable connection

JUMP : indicates the jumper setting of the receiver. If a number is shown, the respective jumper is closed, while the symbol "-" indicates that the jumper is open. The meaning of the jumper configurations is given in 9.2.

7.4 Auto

Receiver's automation setting.

In the standard configuration of the receiver this menu and the succeding Alarm are not activated. The following explanation is related to receivers with activated automatic alarms management (see chapter 9.2).

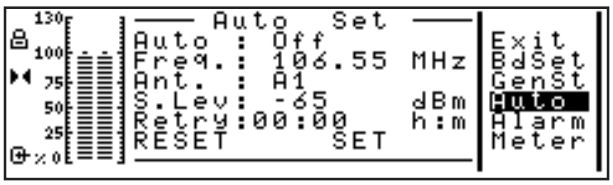

Figure 7-5

When the receiver is fitted with the tunable front-end option, one can configure the receiver so that it will switch to a backup configuration if an alarm condition is raised. The backup configuration includes a frequency value and an antenna input, that can differ or not from the normal setting.

Auto : select On to activate the automatic switching

Freq : Backup configuration frequency

Ant. : Backup configuration antenna input

S.Lev : Minimum level, in dBm, admitted for the backup configuration received signal. If Retry is set to 00:00, the receiver will switch back to the default setting when the signal level goes below this threshold.

Retry : Time interval (hours : minutes) to wait before the receiver switches from the backup setting to the default one. If set to 00:00, the receiver will switch back automatically if the backup received signal goes below S.Lev

RESET : forces the switching to the default setting

SET : forces the switching to the backup setting

7.5 Alarm

In its standard configuration, the receiver has this menu, the connected submenus and the former `Auto` are not activated. The following explanation is related to receivers with activated automatic alarms management (see chapter 9.2).

Using this menu, it's possible to set the way the alarm system of the receiver intervenes. For each submenu, this menu indicates if it's activated or not.

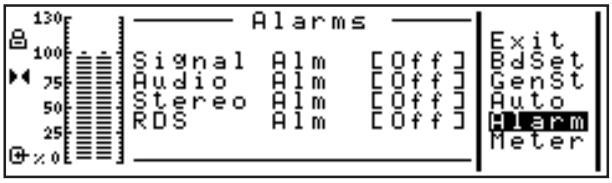

Figure 7-6

To get into one of the submenus, push the encoder when the cursor is on the desired item. Hereafter you will find the explanation of the submenus.

7.5.1 Signal Alarm

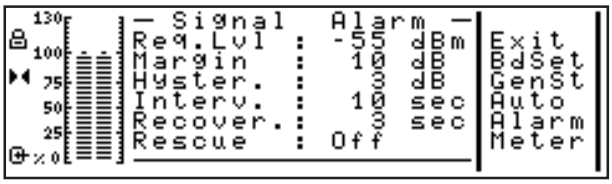

Figure 7-7

Setting of the alarm related to the received signal level for the standard working frequency. The alarm will be raised when the signal level remains below the level (`Req.Lev - Margin`) for `Interv` seconds. The alarm will be cancelled when the signal goes below the level (`Req.Lev - Margin + Hyster`) for `Recover` seconds.

`Req.Lev`
: setting of the level normally required for the received signal

`Margin`
: attenuation margin permitted for the received signal without the alarm being raised

`Hyster`
: Level histeresys to activate/deactivate the alarm. This setting permits to avoid instability situations when the received signal level fluctuates around the threshold level

`Interv`
: delay for the alarm to be reised (the level has to remain below the set level during the time defined by this variable before the situation being interpreted as alarm)

Recover
: delay for the alarm to be cancelled (the level has to remain above the set level during the time defined by this variable before the alarm situation being cancelled)

Rescue
: activates or deactivates the alarm. When the alarm is deactivated, the signal level that has been set will be used only by the audio exchange (or muting) function.

7.5.2 Audio Alarm

Audio level alarm setting. When this alarm is activated, the receiver will monitor the modulation level in the received signal, and an alarm situation will be signalled depending on the parameters set in this menu

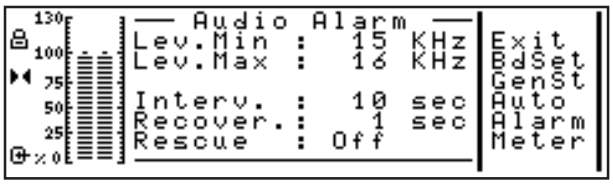

Figure 7-8

Lev.Min
: minimum modulation level in kHz under wich the audio alarm wil be raised

Lev.Min
: modulation level in kHz above wich the audio alarm will be cancelled

Interv
: delay for the alarm to be raised (the level has to remain below the set level during the time defined by this variable before the situation being interpreted as alarm)

Recover
: delay for the alarm to be cancelled (the level has to remain above the set level during the time defined by this variable before the alarm situation being cancelled)

Rescue
: activates or deactivates the alarm. When the alarm is deactivated, the receiver will not signal modulation level related alarms

7.5.3 Stereo Alarm

Stereo operation alarm setting. When this alarm is activated, the receiver will monitor the level of the pilot tone component in the demodulated signal, and an alarm situation will be signalled depending on the parameters set in this menu

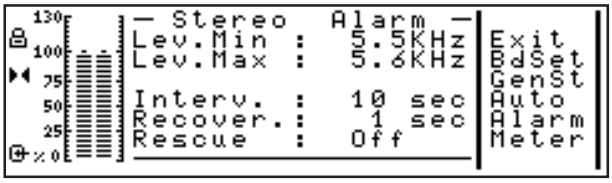

Figure 7-9

`Lev.Min`
: minimum modulation level in kHz due to the pilot tone under wich the stereo alarm wil be raised

`Lev.Max`
: modulation level in kHz due to the pilot tone above wich the stereo alarm will be cancelled

`Interv` delay for the alarm to be raised (the pilot tone level has to remain below the set level during the time defined by this variable before the situation being interpreted as alarm)

`Recover`
: delay for the alarm to be cancelled (the pilot tone level has to remain above the set level during the time defined by this variable before the alarm situation being cancelled)

`Rescue` activates or deactivates the alarm. When the alarm is deactivated, the receiver will not signal pilot tone level related alarms

7.5.4 RDS Alarm

Setting of the alarms related to the correctness of the received RDS data.

This submenu is not active if the RDS decoder board is not installed.

7.6 Meter

This menu is used to visualize the measurements of a series of parameters related to the received signal.

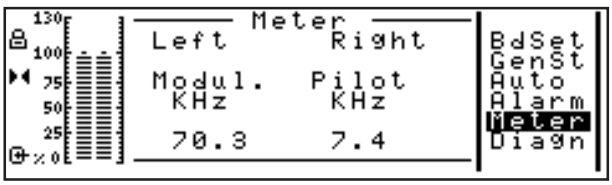

Figure 7-10

When the software is visualizing this menu, the VU meters in the left part of the display show the items that are selected in the menu (when the software is in any othe menu, the VU-meters always show the modulation level). Note that when the software is in this menu, the audio and stereo alarms are momentarily inactive.

7.7 Diagnostics

Using this menu, the user can read a few values that can be useful to check the good working of the piece of equipment.

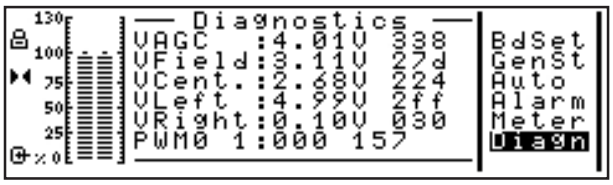

Figure 7-10

The reported values are the analog and digital representations of some internal voltages.

7.8 Power Supply

This menu displays the measurements of the different internal power supply voltages

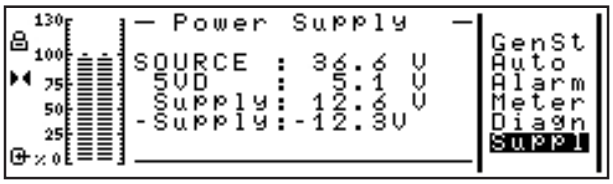

Figure 7-10

7.9 Stereo Set

Stereo decoder board setting menu. This menu will be present only if the stereo decoder option is provided.

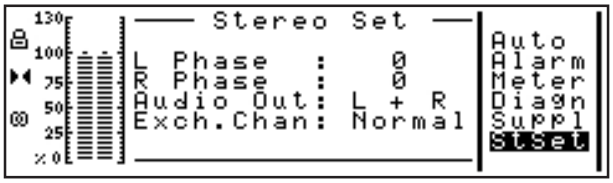

Figure 7-10

`L Phase`

Left channel phase setting, normal (0) or inverted (180).

`R Phase`

Right channel phase setting, normal (0) or inverted (180).

`Audio Out`

setting of the stereo decoder output. The possible choices are `L & R` or `(L+R)/2`. In the first case, the decoder output will give the decoded signal, while in the second case on both channel there is the mono signal reconstructed by the decoder

`Exch.Chan`

this menu item permits to exchange the left and the right channels (`Excha.`) or to leave them unchanged (`Normal`)

8. Technical Specifications

8.1 Physical specifications

Panel Size	483 mm (19”) x 88 mm (3 1/2”) (2 HE)
Depth	377 mm
Peso	10.7 Kg
Temperature range	-10 °C ÷ 50 °C

8.2 Electrical Specifications

RF Section

Frequency range	87.5 MHz ÷ 108 MHz
Channel spacing	10 kHz
Tuning	Sinthesized PLL
Frequency stability	±1ppm from -10°C to 50°C
RF input connector	"N" type (optional 2nd “N” type connector)
RF input impedance	50 Ohm
Frequency setting	direct, software based
RF maximum input level	+23 dBm
Muting level	software selectable, 0 dBm to -100 dBm
IF	10.7 MHz, 700 kHz
Image frequency rejection	> 80 dB

MPX Operation

Output connectors (type, impedance, level)	1 BNC, 50 Ω, 18 dBu (in parallel with XLR) 1 XLR, 50 Ω, 24 dBu 1 BNC, 50 Ω, 0 dBu on 50 Ω, 6 dBu on 600Ω, buffered output capable to drive a 50 Ω load with 250 mt. cable
S/N (L and R channels, external measuring stereo decoder)	72 dB, RMS, filter 20 Hz - 20 kHz, deenph. 50 µs 61 dB, QuPk, filter CCIR weighted, deenph. 50 µs
Amplitude/frequency response	± 0.07 dB (40 Hz ÷ 60 kHz) ± 0.5 dB (60 kHz ÷ 75 kHz)
Stereo separation (with external measuring stereo decoder)	> 55 dB (40 Hz ÷ 15 kHz)
Total harmonic distortion	< 0.1 %

Stereo operation (with optional stereo decoder)

Output connectors (type, impedance, level)	2 XLR, 50 Ω, 24 dBu
Sensitivity	< 200 µV for 54 dB S/N QuPk weighted CCIR filter, deenph. 50 µs
Dynamic selectivity at ± 300 kHz	35 dB
S/N	70 dB, RMS, filter 20 Hz - 20 kHz, deenph. 50 µs 60 dB, QuPk, filter CCIR weighted, deenph. 50 µs
Amplitude/frequency response	± 0.25 dB (40 Hz ÷ 15 kHz)

Stereo Separation	> 50 dB (40 Hz ÷ 15 kHz)
Deemphasys	0, 25 µs, 50 µs, 75 µs
Total harmonic distortion	< 0.25 %

Mono operation

Output connector (type, impedance, level)	XLR, 50 Ω, 24 dBu
Sensitivity	< 12 µV for 54 dB S/N QuPk filter CCIR weighted deenph. 50 µs
Dynamic selectivity at ± 300 kHz	33 dB
S/N	74 dB, RMS, filter 20 Hz - 20 kHz, deemph. 50 µs 61 dB, QuPk, filtro CCIR weighted, deemph. 50 µs
Amplitude/frequency response	± 0.25 dB (40 Hz ÷ 15 kHz)
Deempasys	0, 25 µs, 50 µs, 75 µs
Total harmonic distortion	< 0.1 %

General characteristics

Power supply	170 V ÷ 250 V 90 V ÷ 135 V
Power consumption	< 50 VA

Interfaces

Serial	DB9, RS 232 DCE/DTE selectable optional RS 485 with external convertion
Telemetry	DB25

Options

/05	Internal stereo decoder
/06	Internal RDS decoder
/07	Tunable RF front-end

9. Internal Description

9.1 Modules Identification

Figure 9.1 represents the upper view of the receiver. In the following the different modules are enumerated.

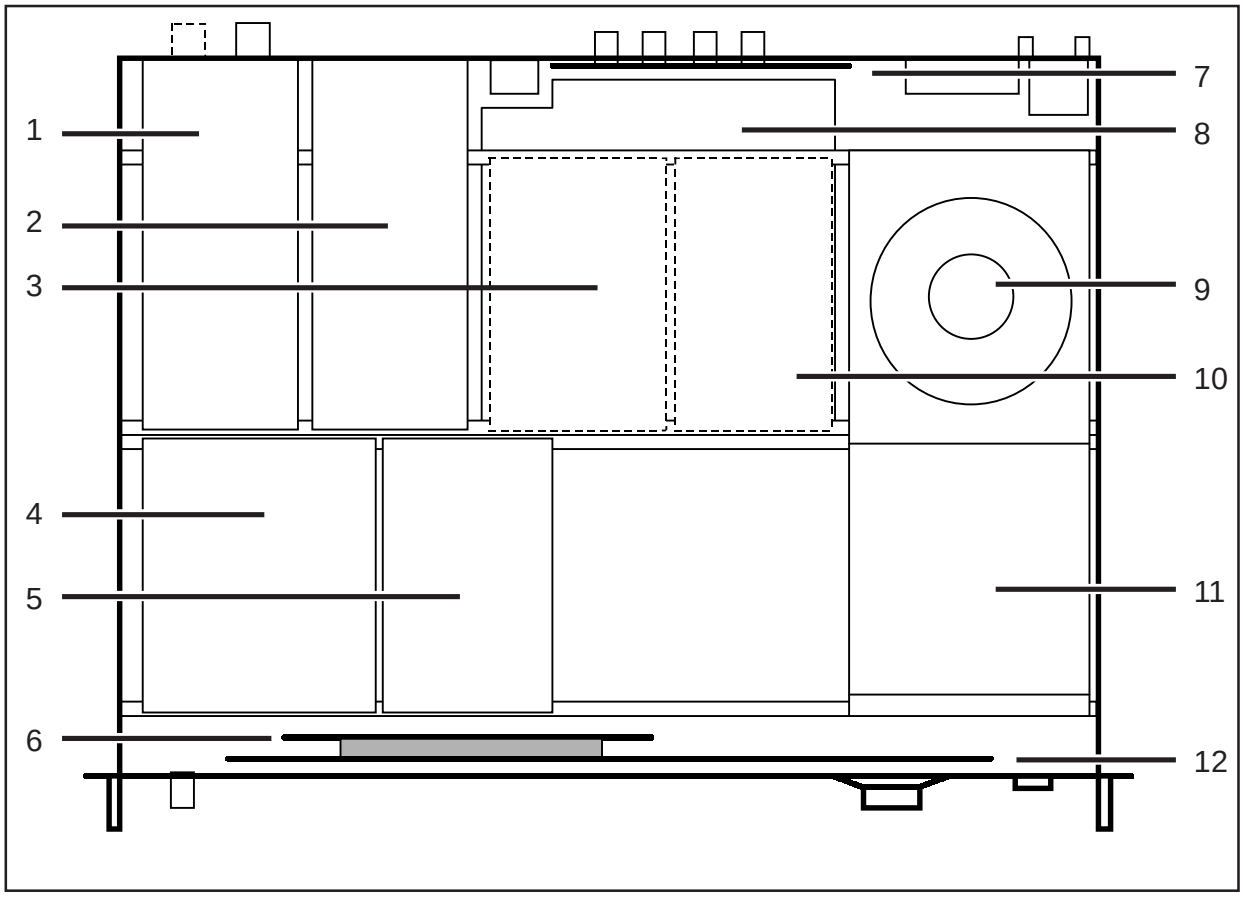

Figure 9-1

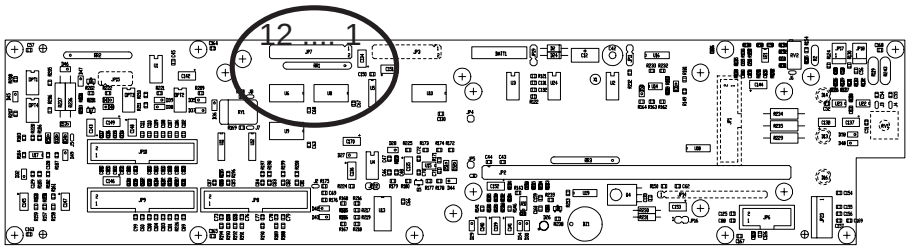
[1] RF front-end
[2] IF section 700 kHz
[3] Stereo decoder board (option)
[4] PLL/VCO section (the VCO box is on the lower side)
[5] Discriminator
[6] CPU board
[7] Audio output board
[8] Audio board (the component side is on the lower side)
[9] Transformer
[10] RDS decoder board (option)
[11] Power supply (on the lower side)
[12] Panel board

9.2 Configuration

The RX1-NV can have different options and configurations. The device's management software configures itself to correctly control the receiver on the basis of the presence or absence of some jumpers on the panel board:



The configuration of the receiver is fixed by JP7 jumpers:

[1,2] Reserved

[3] Stereo decoder presence

[4] RDS board present

[5] Automatic alarms management

[6] Tunable RF front-end presence

[7] Digital visualisation (i.e. non analog) of the received signal level and muting level in the default menu

[8 ... 12] Reserved

Please don't enable the management of options your receiver is not fit with, since this could cause mfunctions (jumpers 3, 4 and 6).

The automatic alarms management (jumper 5 closed) is particularily useful when the alarms board option is present, nevertheless it can be used without it.

The digital visualisation (jumper 7 closed) can be selected, if you want, independendtly from the options the receiver comprises.

9.3 Frequency setting for tuned front-end

The operation described in this chapter is necessary when one wants to change the working frequency of a receiver having the tuned version of the RF front-end.

This operation has to be performed by skilled personnel using suitable instrumentation; the suggested instruments are the following:

a) Spectrum analyser with signal generator (Tracking)

b) Precision stereo audio signal generator/analyser

c) Radio signal generator with low distortion and external modulation input

d) Isolated screwdriver to drive smd capacitance coils

e) A 50 W coaxial cable terminated with a "N" connector and a "SMB" connector, to be used to connect the receiver's preamplifier output to the spectrum analyser.

f) A 50 W coaxial cable terminated with a couple of "N" connectors, to link the output of the RF signal generator with the inpu of the receiver.

g) A 50 W coaxial cable terminated with a "BNC" connector on one side, and a connector suitable for the signal input of the audio analyser on the other side.

h) Coaxial cables adapted for the signal connection between RF signal generator and the audio signal generator/analyser.

The tuning procedure for the front-end is the following:

- Unscrew and remove both the receiver's covers
- Identify the RF fron-end with the help of figure 9-1

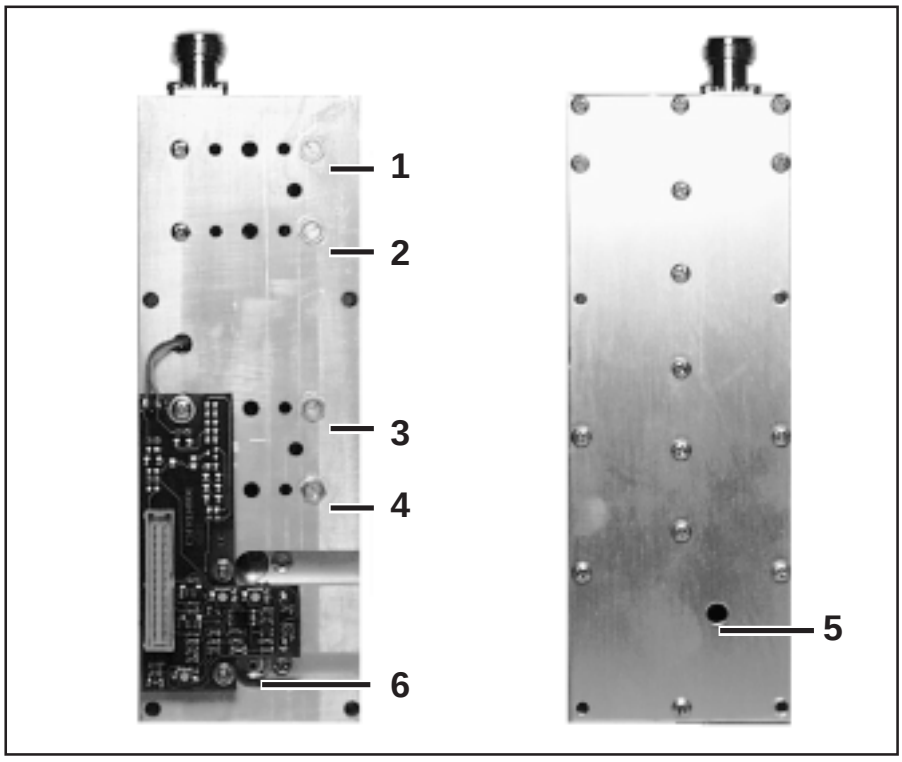


Figure 9-3

- Identify the five variable capacitances that will be used (Figure 9-3): the regulators 1,2,3 and 4 are on the bottom side of the receiver and have a screw-like look; the regulator 5 is a SMD capacitance trimmer mounted on the internal PCB and it is possible to operate on it with the proper screwdriver, without opening the box, through a hole.
- Set the spectrum analyser center frequency to the receiver's new working frequency, and the span shall be at least +/-10MHz.
- Set the tracking signal generator of the spectrum analyser to have a RF output power between -50dBm and -60dBm
- • Connect the signal generator to the receiver's antenna connector.
- In the receiver, disconnect the link between the RF front-end and the IF circuit. Use the SMB connector of the front-end that is now free (6, Figure 9-3) to connect it to the spectrum analyser. Switch on the receiver.

- Adjust all the trimmers so that the amplified signal reaches its maximum at the desired frequency: you should operate on the trimmer controlling the result on the spectrum analyzer. Trimmers 1-4 reduce the tuned frequency when turned clockwise, while trimmer 5 shall be turned left or right depending on the case. At the end of this operation, the signal gain should be between 28dB and 32dB.
- Narrow the frequency span of the spectrum analyser down to +/- 500 kHz.
- Fine-adjust the trimmers again, trying to obtain the best simmetry in the frequency response, while keeping the gain at its maximum value. The response shall be sensibly flat (< 1dB) in a +/- 200 kHz range around the tuning frequency.
- Reestablish the link between the input circuit and the IF circuit.
- The RF front-end at this point can be considered tuned. Before putting in place the receiver's covers, if you have the necessary instruments, you can measure the stereo separation and the distortion of the receiver. If they differ from the values described in the factory tests, very fine adjustments of the capacitance trimmers will improve them. Note that the regulations of this step have to be really fine, to avoid impacting the selectivity of the receiver maximized before at the spectrum analyzer.

Appendice A

Piani di montaggio, schemi elettrici, liste componenti / *Component layouts, schematics, bills of material*

Questa parte del manuale contiene i dettagli tecnici riguardanti la costruzione delle singole schede componenti il RX1-NV LCD. L'appendice è composta dalle seguenti sezioni:

This part of the manual contains the technical details about the different boards of the RX1-NV LCD. This appendix is composed of the following sections:

Appendix B Piani di montaggio, schemi elettrici, liste componenti modificati per la versione 76-90MHz / *Component layouts, schematics, bills of material modified for 76-90MHz version*

Questa parte del manuale contiene i dettagli tecnici riguardanti la costruzione delle singole schede componenti il RX1-NV LCD modificate per il funzionamento nella frequenze 76-90MHz. L'appendice è composta dalle seguenti sezioni:

This part of the manual contains the technical details about the different boards of the RX1-NV LCD modified for the operation in 76-90MHz frequencies. This appendix is composed of the following sections:

R1 220
C1 .1u
VDRAIN
Nome Progetto: RX1-NV LCD
Pagina:1 di 1
Size:A4
Autore: REV.: BERTI J.
Data: 08/11/02
Codice Progetto:/
Nome PC in Rete: \\JACK\
Revisione: 1.1
Nome Parte:FRONT-END 76-90 MHz OUT AMP
File/Cartella: MANUALI\RXLCD\RXLCD\MTSIFRBL0101.1\FOUT100M.DSN
Autorizzazione:
Codice: FOUT100M

R.V.R. ELETTRONICA Spa Revised: October 13, 2000
FOUT100M Revision: 1.0
Bill Of Materials October 13, 2000 17:30:26 Page 1

Item	Quant.	Reference	Part	Description
1	1	CN1	SMB_CS	CONN.SMB A STAMPATO
2	3	C1,C3,C10	.1u	COND. CHIP 0805
3	1	C2	10u	COND. EL. SMD16V
4	5	C4,C5,C8,C9,C11	4n7	COND. CHIP 0805
5	1	C6	1n0	COND. CHIP 0805
6	1	C7B	*	
7	1	C12	470p	COND. CHIP 0805
8	1	C13	3p3	COND. CHIP 0805
9	1	C14	12p	COND. CHIP 0805
10	1	C15	7-50p	
11	1	DGMF1	BF1100R	DG MOSFET SOT143R
12	2	D1,D2	DZ5V1	DIODO ZENER SMD 5V1
13	1	L1	2u2H	IMPEDENZA SMD 1210
14	1	L2	220nH	IMPEDENZA SMD 1210
15	2	R3,R1	220	RES. SMD 0805 5%
16	1	R2	180K	RES. SMD 0805 5%
17	2	R4,R7	22H	RES. SMD 0805 5%
18	2	R5,R8	10H	RES. SMD 0805 5%
19	1	R6	51H	RES. SMD 0805 5%
